Profile

Software Developer at CortexCraft.ai building production AI systems: real-time voice agents over telephony, RAG pipelines, and multi-tenant backends in FastAPI, Node.js, and Spring Boot. I ship against a written rulebook, with decisions recorded as ADRs, one issue per branch, and tests as the merge gate. On AI I hold a hard line, where deterministic code computes the numbers and the model only explains them.

Core Strengths

Languages: Python, JavaScript, TypeScript, Java, Kotlin, SQL

AI/ML: LLM Integration, RAG, Agents & Tool Calling, Guardrails & Evaluation, Context Management, Gemini Live, STT/TTS Pipelines, LightGBM/Prophet

Backend: FastAPI, Node.js/Express, Spring Boot, Celery, Alembic, WebSockets, REST API Design

Frontend/Mobile: React, Vite, Tailwind CSS, Jetpack Compose (Kotlin, Hilt, Room)

Data: PostgreSQL, MongoDB, Neo4j, Supabase/pgvector, Firebase, Room/SQLCIPHER

Platform: Twilio, Plivo, WhatsApp Business API, Docker & Compose, CI/CD, Git/GitLab

Concepts: System Design, Modular Architecture, JWT Auth & RBAC, Query Optimization, Audit Logging, ADR-Driven Development

Experience

Software Developer, CortexCraft.ai

Jan 2026 – Present

- Built and maintain the voice-agent platform (~270 commits): Gemini Live phone agents over Twilio and Plivo, with per-agent RAG grounding, prompt generation, transcripts, and an external REST API that other products call instead of forking the stack.
- Shipped two products on that platform: a multi-tenant lead-calling SaaS, and a collections hub with a visual workflow builder, dry-run prompt preview and run logs (FastAPI, Celery, Alembic/PostgreSQL, React).
- Own production reliability of the call pipeline: fixed outbound routing, added reconnect handling for dropped Gemini sockets, and traced a Docker TLS failure to NAT hairpinning. Also design the prompt frameworks, guardrails and tool-calling orchestration that constrain model output.

Freelance Web & App Developer (Self-Employed)

2023 – 2026

- Delivered full-stack web and app projects end-to-end for local clients: React/Vite front ends, Python/Node.js services and automation scripts, plus ongoing fixes and deployment support.

Projects

AI Personal CFO: Offline-First Android Finance App *Kotlin, Jetpack Compose, Hilt, Room/SQLCIPHER, Coroutines, WorkManager*

- Built 12 deterministic engines (Safe-to-Spend, budgets, forecasting, credit-card cycle, loan amortisation, net worth) as pure Kotlin across a 34-module one-way dependency graph.
- Money is a Long-paise value class with checked arithmetic and largest-remainder allocation, and rates are integer basis points, so no float ever touches a rupee.
- Enforced a hard AI boundary: the LLM never computes a figure, and every number it speaks is checked against engine provenance by a guardrail. Encrypted at rest, fully usable offline.
- 27 ADRs, 160 test files, a migration test for every one of 17 schema versions.

KisanVoice AI: Multilingual WhatsApp Voice Survey Platform *Python, FastAPI, React, MongoDB, WhatsApp Flows, Google STT/TTS, Plivo, Jenkins, Docker*

- Voice and text surveys in 24 configured locales (10+ Indian) from a config-driven language registry, so adding one is a config row rather than a deploy; WhatsApp Flows for long option sets.
- Migrated the platform off its Node backend onto FastAPI and off Sarvam onto Google STT/TTS without interrupting live surveys; Jenkins CI, Docker Compose. 217 of 238 commits authored.

FinGraph AI & MediGraph AI: Hybrid Graph and Vector RAG Assistants *Node.js, React, Neo4j, pgvector, JWT*

- Fused a Neo4j relationship graph with pgvector semantic search so answers are grounded in structure, not just similarity; interactive force-directed graph visualisation.
- Security end-to-end: JWT auth (bcrypt), role-based access applied *before* retrieval (admin / manager / customer; doctor / patient isolation), append-only audit log per query.

Sales & Inventory Forecasting: ML Decision Support *Python, FastAPI, LightGBM, Prophet, PostgreSQL, React, Streamlit, Docker*

- Item-level demand forecasting (LightGBM, Prophet) behind a FastAPI service, turned into policy: safety stock, reorder points, EOQ and ABC classification, with interactive dashboards.

Education & Ways of Working

B.E., Information Science and Engineering, Vivekananda Institute of Technology, Bangalore

One issue per branch; ADRs recorded *before* the code lands; commits tagged with the requirement ID they satisfy; tests as the merge gate.
