Harish G

Automation & RPA Engineer | Agentic Workflows, Approval Gates, CI Pipelines

Bengaluru, India | +91 7892855850 | harishgreddy.work@gmail.com | LinkedIn | GitHub | harishg.com

Profile

I automate the boring path and then put a human at the end of it. The agent opens the pull request; a person merges it. High-risk changes cannot be approved at all, a rejection has to carry a written reason that goes back into the next attempt, and every action lands in a log nobody can edit. That boundary is the whole design. Without it, a wrong edit costs you a main branch instead of a rejected pull request.

Core Skills

Languages	Python · JavaScript · TypeScript · Java · SQL
Automation	LLM Agents & Tool Calling · Approval Gates · Output Guardrails · Jira API · GitHub API · WhatsApp Business API · Excel Import/Export · Bulk CSV Jobs
Backend	FastAPI · Celery · Node.js/Express · Spring Boot · WebSockets · REST API Design
Platform	Jenkins · GitLab CI · GitHub Actions · Docker & Compose · Twilio · Plivo · Redis
Data	PostgreSQL · MongoDB · Redis · Append-Only Audit Logs · Alembic
Concepts	Human-in-the-Loop · Idempotency & Locking · Multi-Tenant SaaS · JWT Auth & RBAC · System Design

Experience

Software Developer, CortexCraft.ai Jan 2026 – Present

- Built and maintain the voice-agent platform (589 of 626 commits on the SaaS platform, 67 of 75 on the core engine): agents that place and answer calls on their own, with an external REST API that other products automate against.
- Design the prompt frameworks, guardrails and tool-calling orchestration that constrain agent behaviour, including explicit escalation to a human rather than an open-ended fallback.
- Shipped LeadCall AI: Celery dial and callback workers behind Redis locks so two workers never dial the same lead, with Excel lead import and an exportable call log.
- Work AI into the delivery process itself, including an agent that turns Jira tickets into reviewed pull requests, and gate merges on GitLab CI with 132 pytest files.

Freelance Web & App Developer (Self-Employed) 2023 – 2026

- Delivered automation scripts and small full-stack apps tailored to client workflows in Python and Node.js.

Selected Projects

JiraFlow Agent *Python, React, Vite, Jira API, GitHub API, LLM Agents*

- Reads a Jira ticket, locates the files it describes, applies the change, and opens a pull request from a dedicated `ai/scrum-<id>` branch whose commit message cites the ticket. Nobody context-switches to do any of it.
- The boundary is the design point. The agent proposes and a human merges, so a wrong edit costs a rejected PR rather than a broken main branch, and every automated change is traceable to the issue that asked for it.

AI Code-Review Gate *Python, FastAPI, Ollama, GitHub API, PostgreSQL*

- An approval gate for AI-generated code changes that an agent cannot argue past: high-risk changes are blocked from approval outright, a rejection requires a written reason and regenerates with that reason fed back, and every reviewer action lands in an append-only audit log. Nothing auto-merges.

KisanVoice AI *Python, FastAPI, MongoDB, WhatsApp Business API, Jenkins, Docker*

- 172 of 192 commits. Survey automation over a channel people already use: programmatic WhatsApp Flow form generation, bulk CSV invite jobs and Excel round-trip, over an append-only audit log with TTL retention and ownership guards. Jenkins builds it, Docker Compose runs it.

Zentrax *Python, Whisper, MediaPipe, Ollama, WebSocket, Docker*

- 12 of 16 commits. Desktop automation driven by voice and gesture, with the LLM running locally through Ollama so no command leaves the machine, and fallback pipelines when a recogniser fails.

Education & Ways of Working

B.E., Information Science and Engineering, Vivekananda Institute of Technology, Bangalore

Feature branches and conventional commits; GitLab CI with 132 pytest files as the merge gate on the voice-agent platform.
