Harish G

Software Engineer | Python Backend, APIs, Integrations, CI/CD

Bengaluru, India | +91 7892855850 | harishgreddy.work@gmail.com | LinkedIn | GitHub | harishg.com

Profile

I write backend code in Python and spend a fair share of my time on what happens after it ships. At CortexCraft I started as an intern and now work as a software developer on a voice-agent platform: REST APIs that other products call, Celery workers, telephony integrations and the CI that gates every merge. Most of what I know about debugging came from production, like the week a Docker TLS failure turned out to be NAT hairpinning. I am learning Go and Kubernetes now, and I use AI tools for code exploration and tests, but I read and own every change that goes in.

Core Skills

Languages	Python · SQL · JavaScript · TypeScript · Java 21
Learning	Go · Kubernetes
Backend	FastAPI · REST API Design · Celery · WebSockets · Node.js/Express · Multi-Tenant SaaS
Data	PostgreSQL · Alembic · Flyway · Redis · MongoDB · Neo4j
Platform	Docker & Compose · GitLab CI · GitHub Actions · Jenkins · Git
Integrations	Twilio · Plivo · WhatsApp · Gemini API · Webhooks
Observability	Structured JSON Logging · Request-ID Tracing · Prometheus Metrics · Runbooks

Experience

Software Developer, CortexCraft.ai May 2026 – Present

- Build and maintain the voice-agent platform, including the external REST API other products integrate against, so one backend serves several shipped products instead of several codebases.
- Own reliability of the call pipeline: fixed outbound routing that picked the wrong carrier, added reconnect handling for sockets that drop mid-call, and tightened termination detection so calls end cleanly.
- Shipped LeadCall AI on the platform: Celery dial and callback workers behind Redis dial locks, per-tenant telephony credentials encrypted at rest, Alembic-migrated PostgreSQL, and an append-only audit log of operator actions.
- Gate merges on GitLab CI with 132 pytest files, working on feature branches with conventional commits and code review.

Software Developer Intern, CortexCraft.ai Jan 2026 – May 2026

- Four months on the same platform. Traced a Docker TLS failure on a self-hosted domain to NAT hairpinning and wrote it up as an incident report.
- Fixed bugs in the Twilio and Plivo telephony integrations and the WebSocket audio path, adding pytest coverage with each fix.

Freelance Web & App Developer (Self-Employed) 2023 – 2026

- Delivered backend services, automation scripts and deployment support for local clients in Python and Node.js.

Selected Projects

KisanVoice AI, multilingual survey platform *Python, FastAPI, MongoDB, Jenkins, Docker*

- Every request carries an `X-Request-ID` that is forwarded or generated and echoed back, every log line is one JSON object with that ID, and each response is logged with status and duration. A Prometheus instrumentator exposes `/metrics`.
- Replaced the Node.js backend with FastAPI and moved the speech provider behind a config-driven registry of 24 locales without interrupting live surveys. Ships with a deployment runbook, a hotfix flow and a rollback procedure.

Lendly, lending platform backend *Java 21, Spring Boot 3.5, PostgreSQL, Flyway, Docker*

- Spring Security with JJWT, Data JPA and Bean Validation; Flyway versioned migrations against PostgreSQL with H2 for tests; GitHub Actions CI and Docker Compose for local environments.

FinGraph AI *Node.js, Express, Neo4j, Supabase pgvector, JWT*

- Two stores behind one query path: pgvector for similarity search and Neo4j for the relationships each hit is enriched with, under JWT authentication and role-restricted admin routes.

Education

B.E., Information Science and Engineering, Vivekananda Institute of Technology, Bangalore
