Harish G

Java Backend Developer | Spring Boot, REST APIs, PostgreSQL, JWT Security

Bengaluru, India | +91 7892855850 | harishgreddy.work@gmail.com | LinkedIn | GitHub | harishg.com

Profile

I write the boring parts carefully. A schema lives in versioned migrations so the database can be rebuilt from empty, the REST contract stays separate from the entity graph so one can change without breaking the other, and the tests run in CI as the gate rather than as a formality. Java and Spring Boot are where I learned to work that way. Python is where I do most of it now.

Core Skills

Languages	Java 21 · Python · TypeScript · JavaScript · Kotlin · SQL
Backend	Spring Boot 3.5 · Spring Security · Spring Data JPA · Bean Validation · JJWT · FastAPI · Node.js/Express · Celery · REST API Design
Data	PostgreSQL · Flyway · Alembic · H2 · MongoDB · Neo4j · Redis
Testing	GitHub Actions · GitLab CI · Jenkins · pytest · Docker & Compose
Frontend	React · Vite · TypeScript · Tailwind CSS
Concepts	DTO-Based Architecture · System Design · Modular Architecture · JWT Auth & RBAC · Multi-Tenant SaaS · Query Optimization

Experience

Software Developer, CortexCraft.ai Jan 2026 – Present

- Built and maintain the voice-agent platform (589 of 626 commits on the SaaS platform, 67 of 75 on the core engine), including the external REST API that other products integrate against instead of forking the stack.
- Shipped LeadCall AI on that platform: a multi-tenant service with Celery dial and callback workers, Alembic-migrated PostgreSQL, per-tenant credentials encrypted at rest, and Redis locks so two workers never dial the same lead.
- Own production reliability of the call pipeline: fixed outbound routing, added reconnect handling for dropped sockets, and traced a Docker TLS failure to NAT hairpinning.
- Work to a disciplined delivery process: feature branches, conventional commits, and GitLab CI with 132 pytest files as the merge gate.

Freelance Web & App Developer (Self-Employed) 2023 – 2026

- Delivered full-stack web and app projects end to end for local clients, including Java and Python services, React front ends and deployment support.

Selected Projects

Lendly, lending platform *Java 21, Spring Boot 3.5, React, PostgreSQL, Flyway, Docker*

- Spring Boot 3.5 on Java 21 with Spring Security and JJWT for stateless authentication, Spring Data JPA for persistence and Bean Validation on the request boundary.
- Flyway versioned migrations against PostgreSQL with H2 standing in for tests, so the schema is reproducible from an empty database; GitHub Actions CI and Docker Compose for local environments; React front end against the REST API.

TaskFlow *Java, Spring Boot, PostgreSQL, Vite, TypeScript*

- 8 of 9 commits. Spring Boot REST API designed around DTOs, so the published contract stays separate from the persistence model and the entity graph can change without breaking clients.
- PostgreSQL persistence behind the service, with a Vite and TypeScript front end for task prioritisation and tracking.

FinGraph AI *Node.js, Express, React, Neo4j, Supabase pgvector, JWT*

- Banking assistant fusing pgvector similarity search with Neo4j: every match is enriched with its graph relationships, such as a loan's borrower, before the answer is generated.
- Stateless JWT authentication with bcrypt-hashed credentials, and admin and audit routes restricted to the ADMIN role.

Education & Ways of Working

B.E., Information Science and Engineering, Vivekananda Institute of Technology, Bangalore

Feature branches and conventional commits; GitLab CI with 132 pytest files as the merge gate on the voice-agent platform.
