Harish G

Junior Software Developer | Python · Node.js · React · Applied AI

Bengaluru, India | +91 7892855850 | harishgreddy.work@gmail.com | LinkedIn | GitHub | harishg.com

Profile

I am a developer in my first full-time role, with three years of freelance client work behind it. What I like is the whole path of a feature: the REST contract, the Python or Node.js service behind it, the React screen in front of it, and lately a model in the middle whose output I treat as untrusted until something checks it. I learn fastest with a reviewer on the other side of the pull request.

Core Skills

Languages	Python · JavaScript · TypeScript · Java · SQL
Backend	FastAPI · Node.js/Express · Spring Boot · Celery · REST API Design · WebSockets
Frontend	React · Vite · Tailwind CSS · Socket.io
Data	PostgreSQL · MongoDB · Redis · Neo4j · Supabase/pgvector · pandas · NumPy
AI / ML	LLM APIs (Gemini, Groq, Ollama) · RAG & embeddings · tool calling · output guardrails · scikit-learn · LightGBM · PyTorch · TensorFlow/Keras
Tooling	Git · Docker & Compose · GitLab CI · GitHub Actions · Jenkins · pytest · Postman

Experience

Software Developer, CortexCraft.ai Jan 2026 – Present

- Built and maintain the voice-agent platform (589 of 626 commits on the SaaS platform, 67 of 75 on the core engine): FastAPI services, a React dashboard for configuring agents, and an external REST API that other products call instead of forking the stack.
- Integrated Gemini into live call handling with per-agent RAG grounding and tool calling, and wrote the guardrails that constrain what the model is allowed to return, so extracted call data is coerced to its declared type before anything downstream trusts it.
- Debugged production failures down to a cause rather than a restart: outbound call routing, reconnect handling for dropped Gemini sockets, and a Docker TLS failure traced to NAT hairpinning.
- Lead author (172 of 192 commits) on the multilingual survey platform. Migrated it off a Node.js backend onto FastAPI and swapped the speech provider behind a config-driven registry of 24 locales, without interrupting live surveys.

Freelance Web & App Developer (Self-Employed) 2023 – 2026

- Delivered React and Vite front ends, Python and Node.js services and automation scripts for local clients, plus ongoing bug fixes and deployment support.

Selected Projects

KisanVoice AI *Python, FastAPI, React, MongoDB, Node.js, Google STT/TTS, Socket.io, Docker*

- 172 of 192 commits. WhatsApp survey platform: FastAPI backend, MongoDB storage, and a React admin dashboard with an audio QC workflow and Excel export that receives live call events over Socket.io.
- Migrated the platform off its Node.js backend onto FastAPI without interrupting live surveys; 24 locales come from a config-driven registry, so adding one is a config row rather than a deploy.

Inventory & Sales Prediction *Python, LightGBM, pandas, FastAPI, PostgreSQL, Docker*

- Engineered the features three quantile LightGBM models train on, giving a lower, median and upper bound per product-store-day: lags at 1, 2, 3, 7, 14 and 28 days plus rolling mean, standard deviation, minimum and maximum windows and calendar features.
- Took it from concept to serving in one pipeline: train/validation/test split, WMAPE, MAE, RMSE and R^2 scoring, joblib persistence, a model loader that hot-reloads without a restart, a retrain entry point, and FastAPI serving in Docker.

FinGraph AI *Node.js, Express, React, Neo4j, Supabase pgvector, Hugging Face, Groq, JWT*

- Built a banking assistant fusing pgvector similarity search over MiniLM embeddings with Neo4j, so every match is enriched with its graph relationships before the answer is generated rather than returning the closest matching text.
- Express REST API behind a React chat client, with JWT authentication over bcrypt-hashed credentials and admin routes restricted to the ADMIN role.

Zentrax *Python, PyTorch, TensorFlow/Keras, scikit-learn, Whisper, Ollama, Docker*

- 12 of 16 commits. Built a QLoRA fine-tuning pipeline for SmolLM2 with checkpoint resume and TensorBoard, plus a Keras LSTM classifier and a scikit-learn random forest for gesture and voice-command recognition, behind a desktop assistant whose LLM runs locally through Ollama.

Education & Ways of Working

B.E., Information Science and Engineering, Vivekananda Institute of Technology, Bangalore

Scrum tickets, feature branches and conventional commits; GitLab CI with 132 pytest files as the merge gate on the voice-agent platform.
